

Hydro-Channel Plus

Innovative Drainage Channel

HYDRO-CHANNEL PLUS (installed along perimeter walls and under basement floor) A 3/8" gap allows water, that runs down the wall, to enter the system.

HYDRO-CHANNEL PLUS has been designed and manufactured to better manage ground water hydrostatic pressure build-up by insuring basement water has an unobstructed path to a sump pit or daylight drain. It does this by capturing water, entering the basement through the "cold joint" or cracks in the walls, and channelling it to a sump or day-light drain. Installed in homes coast-to-coast, HYDRO-CHANNEL PLUS is proven to be 100% effective* and a key component to a truly protective interior water-proofing drain system. Ideal for retro-fitting existing basements or can be used in new construction as well. To order or get product information call:

Benefits

- Allows the wall to rest against the floor when repoured.
- Can be sealed where overlapped with PVC glue.
- Large dimples to allow better water movement.
- Protects cold joints when in place.

*When installed according to manufacturer's guidelines and recommendations.
